Home Depot West Wichita Drainage Report

Introduction:

The purpose of this drainage report was to determine if stormwater detention would be required on the proposed Home Depot site in west Wichita, KS. The report was performed according to standard City of Wichita procedures for calculating stormwater runoff for a 100-year storm.

Site Information:

The site is located in the Carriage House Plaza 2nd Addition, north of west Kellogg (U.S. 54) and east of Tyler Road in west Wichita. The property includes approximately 24 acres, which is currently undeveloped. Storm and sanitary sewer lines have been constructed through this property. The storm sewer includes a 10'x7' reinforced concrete box (RCB) which runs from north to south through the middle of the property. This box carries drainage from this site and from land to the north. This 10'x7' RCB is the main focus of this report.

Drainage Basin:

The drainage area for the 10'x7' RCB includes approximately 186 acres. Land uses for this area include 144 acres of single family housing, 16.5 acres of light commercial development, and 25.5 acres of undeveloped land.

Existing Conditions:

The volume of runoff for existing conditions was calculated based on the rational method for a point at the southeast corner of the drainage area. The flow at this point for a 100-year storm is 438 cfs. The capacity of the 10'x7' RCB at this point is 411 cfs. Therefore, the runoff has exceeded the box capacity for a 100-year storm with the current conditions.

Detention:

According to City of Wichita policies, stormwater detention will be required with any future development on this site. Detention is required if the existing stormwater sewer is not large enough to handle runoff from the site under fully developed conditions. As discussed above, the existing 10'x7' RCB is not large enough to handle runoff under existing conditions, not to mention developed conditions.

Since the entire 186 acre drainage area north of the site drains into the 10'x7' RCB, the ability of this system to function properly depends on the adequacy of the RCB. Therefore, instead of focusing on only the 24 acre site, the detention calculations were based on the 186 acre drainage area.

Runoff calculations were based on a 60 minute time of concentration, which is the time of concentration for the entire drainage area. The runoff generated using the rational method for the 24 acres in an undeveloped state is 57 cfs. Runoff generated by the same 24 acres in developed state will be 73 cfs.

Runoff from the buildings and parking areas to the north of the buildings is calculated at 33 cfs. This is based on 10 acres, with a time of concentration of 60 minutes. Based on preliminary calculations, a detention pond covering approximately 20,000 sq. ft. with a depth of 4 ft. would be adequate for detaining 33 cfs. This pond could be located in the northeast corner, as shown in site plan C1-e. The pond shown is very close to 20,000 sq. ft. The detention pond will drain through an 18" pipe running from the pond to the 10'x7' RCB. At the time of peak runoff, the flow through this pipe will be 15 cfs. (Calculations are shown in Appendix 1)

By draining 33 cfs into the pond, and only allowing 15 cfs into the 10'x7' RCB at the time of peak runoff, 18 cfs is detained. This is greater than the 15 cfs increase caused by development of this 24 acre site. The remaining runoff from the site would be allowed to drain to the south side of the property and enter the 10'x7' RCB through a stormwater sewer system without detention.

Conclusions:

The 10'x7' RCB is not adequate for the 100-year storm under current conditions. Therefore, any future development in this drainage basin will require stormwater detention according to City of Wichita policies. Subject to the City's approval, a detention pond of approximately 20,000 sq. ft., 4 ft. deep in the northeast corner of the property should be adequate. This report is a preliminary analysis of the drainage for the 24 acre site. A design of an on-site stormwater sewer system and detention pond will need to be performed as part of the site development package.

98022 Home Depot West | Time of Conc. | 3-12-98 | DK

Assume 500' Overland Flow @ 0.5% slope: V= 0.20 ft/sec

500 ft / .20 ft/sec = 2500 sec

From Inlet @ Woodchuck & Hendryx:

Length	Pipe Size	Slope (%)	Velocity	Time (sec)
282	21"	0.27	2.72	104
103	24"	0.24	2.8	37
475	30"	0.15	2.56	186
492	30"	0.23	3.20	154
55.4	30"	0.34	3.84	14
470	36"	0.13	2.72	172
598	36"	0.26	3.84	156
74	54"	0.26	5.04	15
			TOTAL =	838 sec.

1971' 10'x7' RCB @ 0.10% V= 5.9 ft/sec

1971' / 5.9 ft/sec = 334 sec

Total TOC: 2500 + 838 + 334 = 3672 / 3600 = 1.02 HRS
