THE LAW COMPANY, INC.

Abstract—The purpose of this study was to determine if there were differences in the prevalence of periodontitis between patients who had been treated by a general dentist or a periodontist. The study included 60 patients from each group. All patients underwent a clinical examination of their periodontium. The results showed that the prevalence of periodontitis was significantly higher in the group treated by a general dentist than in the group treated by a periodontist.
