

**DRAINAGE PLAN
RITCHIE INDUSTRIAL PARK
WICHITA, SEDGWICK COUNTY, KANSAS**

February 28, 2002

INTRODUCTION

This report provides information and supporting documentation for the "Drainage Plan" located in Section 29, T-26-S, R-2-E in Wichita, Sedgwick County, Kansas. The "Drainage Plan" being submitted herein is intended to serve as a guide for the design of streets, stormwater sewers, and site grading to the proposed development. Modifications to structures, pipes, etc. may be made as necessary during the final design in order to obtain the most economical design and construction possible.

INITIAL DATA

The plat contains three separate existing drainage basins. These basins are delineated in the pre-developed drainage section of the report. The general topography of each basin drains from west to east and east to northwest, with the high point approximately three hundred feet west of the east line. The plat's average existing grade is about one percent. The total area of the plat is 24.5 acres with approximately 3.4 acres of offsite draining into the proposed pond.

The existing soil types per S.C.S. "Soil Survey of Sedgwick County" is Farnum loam, Rosehill and Irwin silty clay loam. Eighty-five percent of soils are classified in hydrologic group D with the remaining classified as B.

The tract of land is located in a Federal Emergency Management Agency (FEMA) Zone C as mapped on the Federal Insurance Rate Map (FIRM) community-panel number 200321 0150, effective date June 3, 1986 and FIRM community-panel number 200328 0015, effective date May 15, 1986.

The time of concentration (T_c) for the site was determined using the S.C.S method TR-55 and the standard fifteen-minute minimum. The T_c for the three separate existing drainage areas were calculated using the lengths, average slopes and other input variables found in the pre-developed and T_c sections of the report.

COMPUTATIONS

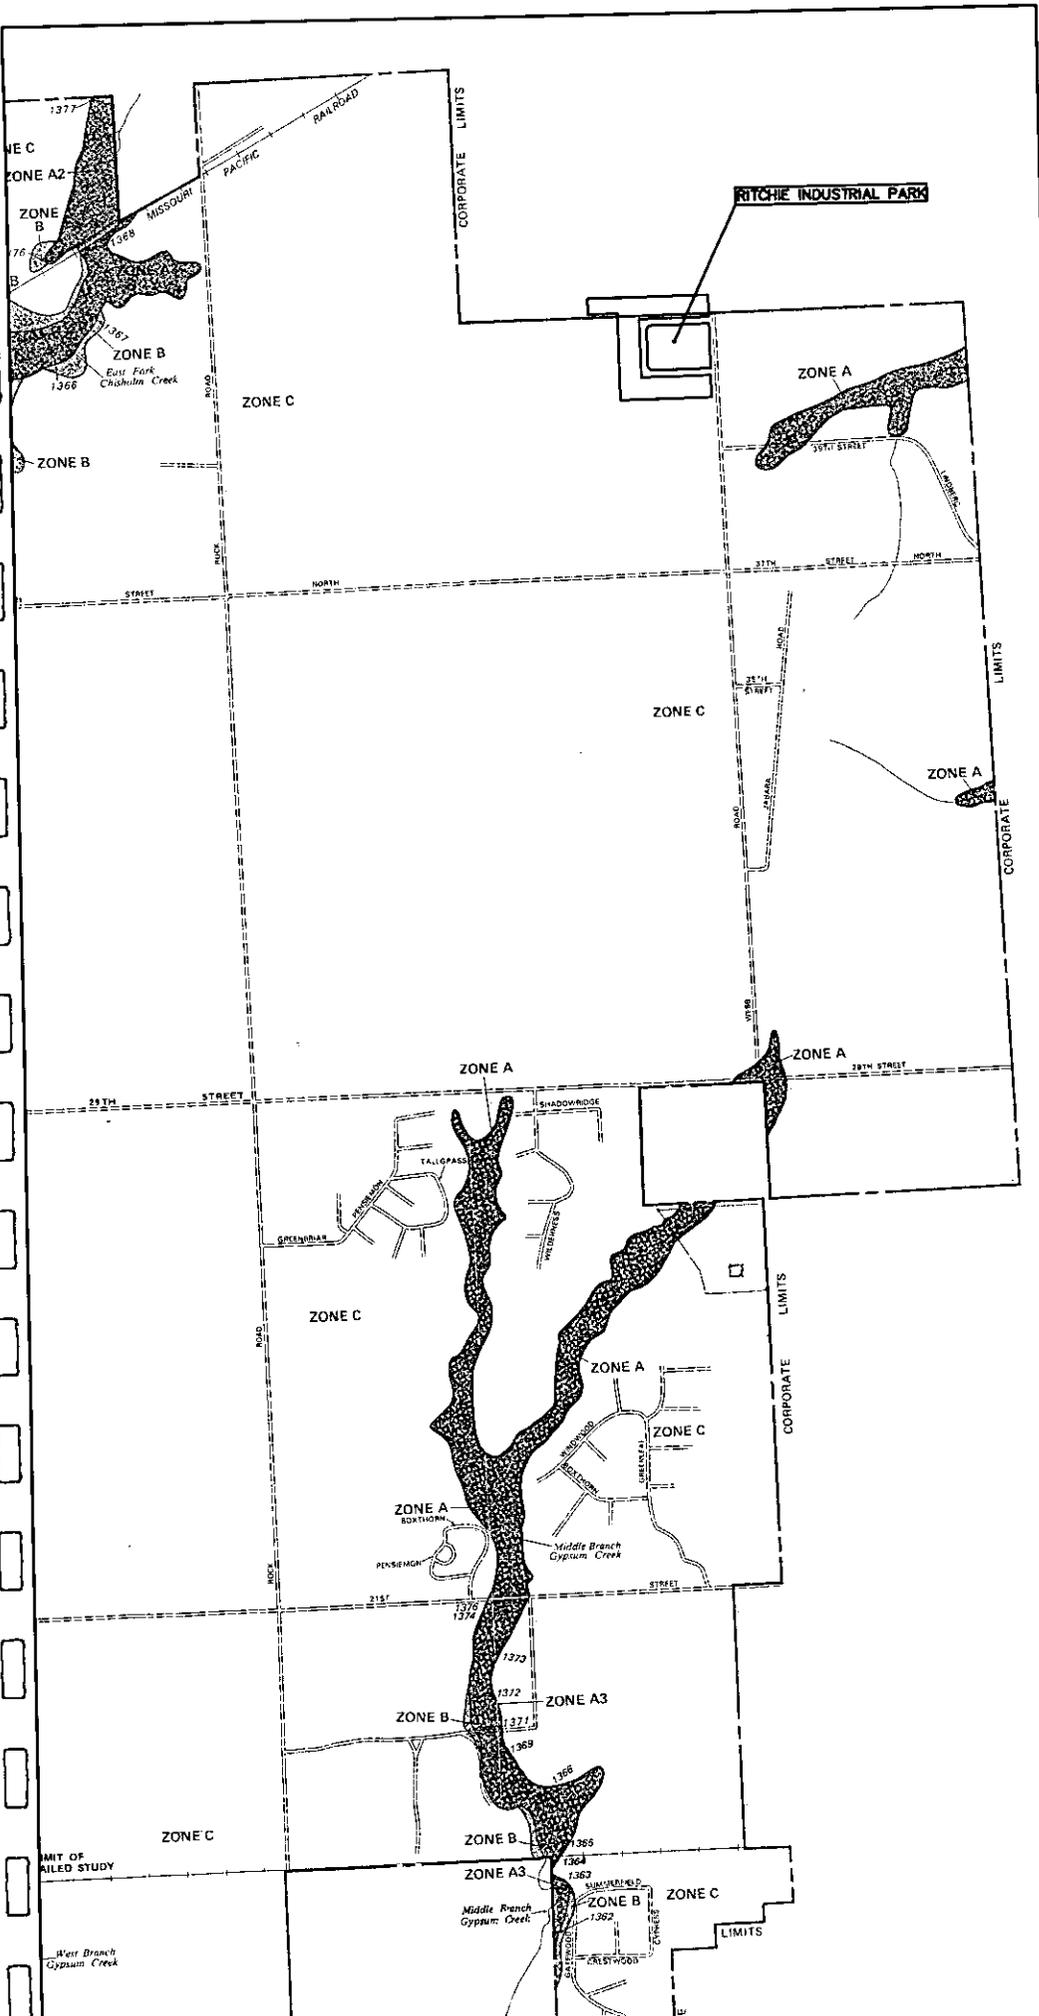

The rational method was used to calculate each individual basin's peak flow rate and the input variables and results are found on the face of the drainage plan sheet. The west drainage basin was routed using PondPack to generate pre/post-developed unit hydrographs. The pond's size and outfall structures were designed to discharge a rate that does not exceed pre-developed conditions. The table's below summarizes the drainage area, stage, and discharge of the proposed pond. See the post-development pond routing section for specific details.

Table 1. Ritchie Industrial Park – D.A. = 22.16 ac.

<i>Storm Event</i>	<i>Q (cfs)</i>	<i>Stage (ft)</i>
5-Yr	19	217.3
10-Yr	49	218.2
100-Yr	100.1	218.8

The proposed subdivision will drain by the combination of storm sewer and overland flow. The runoff will concentrate in the road right-of-way and at the area inlet locations. The storm sewer systems were designed to carry the five-year storm event in the pipe as the hydraulic grade lines indicate in the system reports. Once the system surcharges the drainage will flow overland in the form of a v-ditch/flume constructed to convey runoff equal or greater than the capacity of the proposed v-ditch.

The set of inlets at the upstream end of 41st Street north are bypass inlets. Street hydraulic calculations were performed using HY-22 to determine the maximum possible interception of the inlets and was added to the inlet node for system one StormCad calculations. The bypass runoff was added to the downstream sump inlets. The input variables for this procedure are found in the system one's StormCad section.

Rd : Rosehill - Hydrologic Group D (58% of Drainage Basin)

SCS TR-55 Sheet Flow

$$T_c = \frac{[.007(n \times L_f)^{0.8}]}{[(P^{0.5})(S_f^{0.4})]}$$

Where: Tc = Time of concentration, hrs
 n = Mannings n
 L_f = Flow length, ft
 P = 2yr, 24hr Rain depth, inches
 S_f = Slope, ft/ft

SCS TR-55 Shallow Concentrated Flow

Unpaved surface:

$$V = 16.1345 \times (S_f^{0.5})$$

Paved surface:

$$V = 20.3282 \times (S_f^{0.5})$$

$$T_c = \frac{\left(\frac{L_f}{V}\right)}{(3600 \text{ sec/hr})}$$

Where: V = Velocity, ft/sec
 S_f = Slope, ft/ft
 Tc = Time of concentration, hrs
 L_f = Flow length, ft

SCS Channel Flow

$$R = \left(\frac{Aq}{Wp}\right)$$

$$V = \frac{\left[\left(1.49 \times R^{2/3}\right)\left(\sqrt{S_f}\right)\right]}{n}$$

$$T_c = \frac{\left(\frac{L_f}{V}\right)}{(3600 \text{ sec/hr})}$$

Where: R = Hydraulic radius
 Aq = Flow area, sq.ft.
 Wp = Wetted perimeter, ft
 V = Velocity, ft/sec
 S_f = Slope, ft/ft
 n = Mannings n
 Tc = Time of concentration, hrs
 L_f = Flow length, ft

Ritchie Industrial Park
Worksheet for Triangular Channel

Project Description	
Project File	f:\hydro\projects\ritchie\ditch.fm2
Worksheet	V-Ditch
Flow Element	Triangular Channel
Method	Manning's Formula
Solve For	Discharge

Input Data	
Mannings Coefficient	0.030
Channel Slope	0.010000 ft/ft
Depth	1.50 ft
Left Side Slope	4.000000 H : V
Right Side Slope	4.000000 H : V

Results		
Discharge	36.06	cfs
Flow Area	9.00	ft ²
Wetted Perimeter	12.37	ft
Top Width	12.00	ft
Critical Depth	1.38	ft
Critical Slope	0.015443	ft/ft
Velocity	4.01	ft/s
Velocity Head	0.25	ft
Specific Energy	1.75	ft
Froude Number	0.82	
Flow is subcritical.
