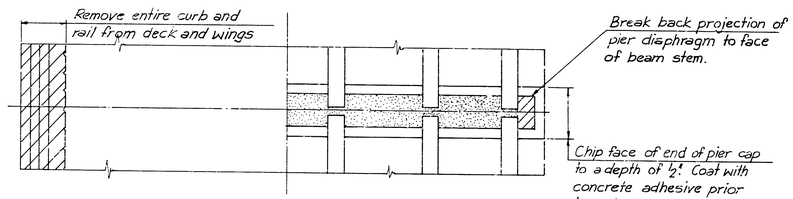
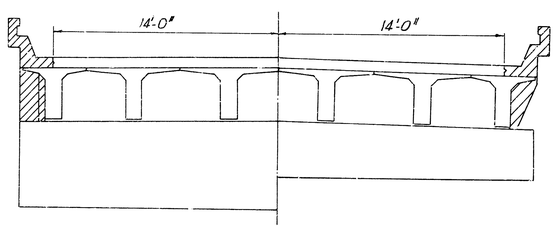
PLAN AT ABUTMENT



PLAN AT PIER



HALF SECTION NEAR ABUTMENT

HALF SECTION NEAR PIER

LIMITS OF REMOVAL OF EXISTING STRUCTURE

GENERAL NOTES:

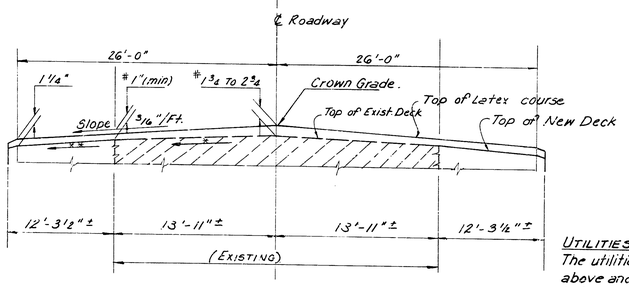
BRIDGE EXCVATION: All bridge excavation shall be Class III. See Sheet 14 for limits of Pay Excavation.

SOUNDINGS: Sounding information shown on Sheet 2 is as obtained from borings made in the field by Engineering Testing Company, and represents the best information available to the City of Wichita.

BEARING PILES: Piles shall be 12" prestressed concrete piles in abutments and 14" prestressed concrete piles in piers, as detailed on Sheet 13. Piles shall be driven to the penetration shown unless in the opinion of the Engineer such penetration cannot be secured without injury to the pile. The design bearing value of the piles are 25 tons per pile in Abutments, 33 tons per pile in Pier #1, and 45 tons per pile in Piers # 2 and #3. All piles except those at Abutment #1 and Pier #1 shall be driven to the design bearing values. Driving of piles for Abutment #1 and Pier #1 shall be halted as soon as design bearing values are achieved, or at one foot above cut-off elevation, whichever occurs first. Further driving may result in reduced bearing values.

PILE DRIVING: All piles shall be driven with a steam or diesel hammer. If a diesel hammer is used, sufficient hammer data shall be provided to permit rating by the Engineer before driving starts.

REMOVAL OF EXISTING STRUCTURE: See this sheet for details of removal of existing structure.



* Exist. Transverse Slope (Varies) flatter than ⅜"/ft.

** New Deck Transverse Slope ⅜"/ft. ±

Note: Latex course thicknesses noted on this detail are based on field notes and are approximate.

LATEX COURSE DETAILS

CONCRETE: Class AAA(AE) Concrete shall be used in the bridge construction, including abutments, piers, diaphragms, deck, rail, approach slabs and reinforced concrete riprap, except for prestressed concrete beams. Bevel all exposed edges with a 3/4" triangular molding unless otherwise noted.

REINFORCING STEEL: All reinforcing steel shall be Grade 40, minimum. All dimensions relative to reinforcing steel placement are to centerline of bars unless otherwise noted. All dimensions shown in bending diagrams are out to out of bars.

DECK TREATMENT: Sidewalks, approach slabs and reinforced concrete riprap shall be cured with emulsified Linseed Oil, in accordance with the K.D.O.T. Specifications. As bricking of concrete traffic rail is completed, curing shall be continued by spraying with Linseed Oil Emulsion. Bridge (Roadway) deck shall receive a wearing course consisting of Latex Modified Concrete. Thickness will vary from a minimum of 1 inch to a maximum of 2 3/4 inches due to irregularities in the existing deck. See details on this sheet.

APPROACH SLABS: The item of "Approach Slab" includes fine grading, and furnishing, forming and finishing all concrete and reinforcing steel required for one approach slab at each end of the bridge, as detailed on Sheet 11. Class AAA(AE) Concrete shall be used in approach slabs. Approximate quantities, each slab (2 thus): Class AAA(AE) Concrete: 40.2 Cu. Yds., Reinforcing Steel: 5170 Lbs., including 42 Lbs. of welded wire fabric.

REVETMENT MATS: Revetment Mats shall be Fabriform grouted erosion control mats fabricated and installed in accordance with these plans and the Supplemental Specifications.

QUANTITIES: All quantities shown on these plans shall be used as final pay quantities, except that measurement of piling shall be in accordance with the Specifications.

GENERAL REQUIREMENTS: It is the intention of these Plans and Specifications that construction of this project shall be in accordance with applicable Standard Specifications and requirements of the Kansas Department of Transportation and that materials shall conform to these specifications unless otherwise noted.

DESIGN LOADING: H20-44 A.A.S.H.T.O. Spec. (1977 Edition)

UNIT STRESSES:

f'c = 4,000 p.s.i. Class AAA(AE)
fc = 1,600 p.s.i. Class AAA(AE)
fs = 20,000 p.s.i. Reinf.(Gr. 40)

DESIGN PILE PRESSURE:

25 Tons per Pile (Abutments)
33 Tons per Pile (Pier 1)
45 Tons per Pile (Piers 2 & 3)

Utilities

Gas: Arkansas-Louisiana Gas Co.
1630 South Baehr
Wichita, Ks 67218
Mr. Tom Collins. 942-8350

Telephone: Southwestern Bell Telephone Co.
626 N. Broadway
Wichita, Ks 67203
Mr. R.M. Alley 268-2932

Water Main (16"): Wichita Water Department
Engineering 268-4555

Electric: K.G.E. 264-1141

UTILITIES:
The utilities as indicated on these plans, both above and below ground, represent the best information available at this time. It is the contractors responsibility to contact each of the utility companies involved for accurate field location of their utilities prior to beginning any excavation or construction work on this project.

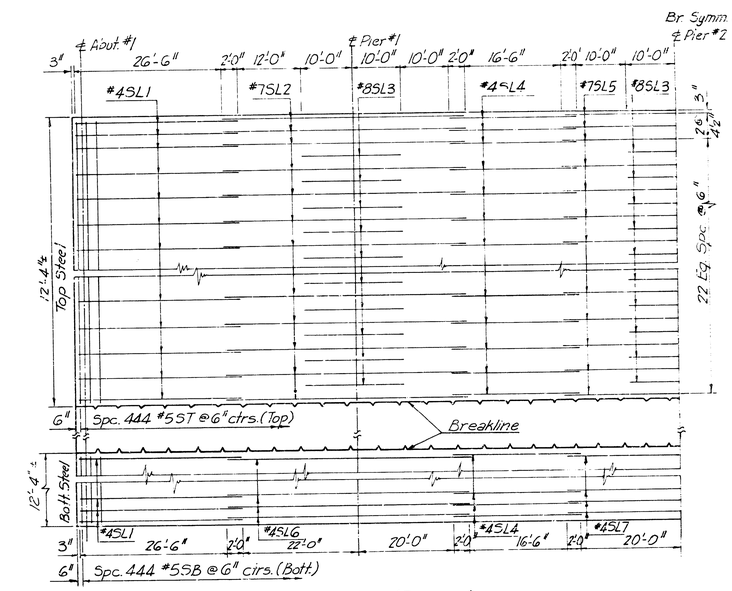
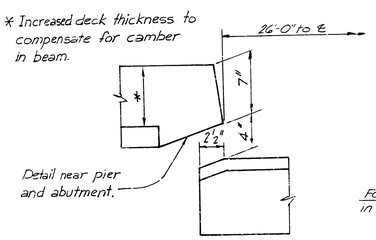
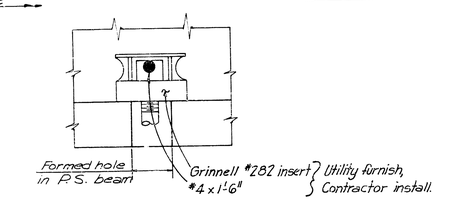
PLAN (SIDEWALK)



PLAN (ROADWAY)



DETAIL "A"



DETAIL "B"

NOTES:

Class AAA(AE) shall be used in the superstructure (Roadway ℄ Sidewalk) including diaphragms and rail, except for prestressed beams. Bevel all exposed edges with a triangular moulding unless otherwise noted.

All dimensions relative to reinforcing steel are to centerline of bars unless otherwise noted.

Beam connections shall not be welded or pier diaphragms placed until all beams have cured a minimum of 28 days. Welding shall preferably proceed across the the bridges, with all welds in one (pier) diaphragm completed in one operation.

Roadway deck adjacent to "Closure Strips" shall be placed prior to the placing of concrete in midspan diaphragms on the same side. Concrete in the closure strip shall be placed not less than 3 days after midspan diaphragms are poured. Deck shall preferably be placed continuously the full length of the bridge. If a joint is used, it shall be at the quarter point short of the pier.

DESIGN LOAD: H20-44 (A.A.S.H.T.O. 1977 Ed.)

UNIT STRESSES: f'c = 4,000 p.s.i. (Class AAA(AE))

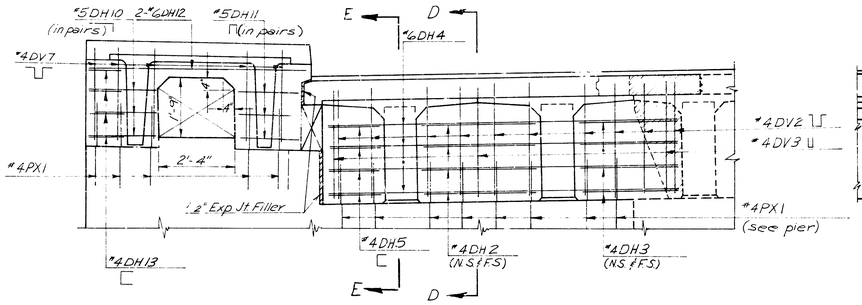
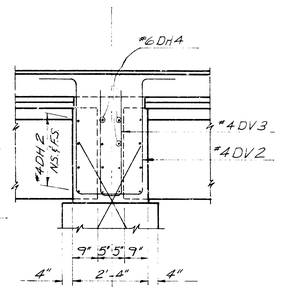
SECTION C-C

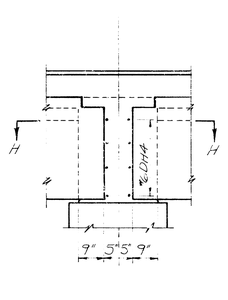


PART ELEVATION OF PIER DIAPHRAGM

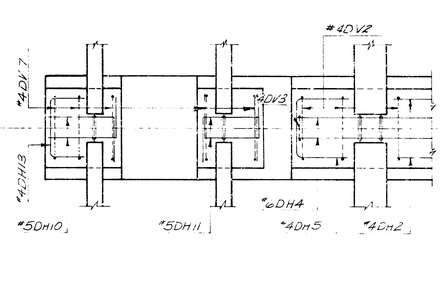
Caution: Prior to drilling in Prestressed Beams contractor shall perform radiographic inspection (such as X-ray photographs) in order to make sure that the drilled holes clear all "Prestressed Strands" in the existing beam. This work shall not be paid for directly but shall be subsidiary to the bid item Class AAA (AE) Concrete.



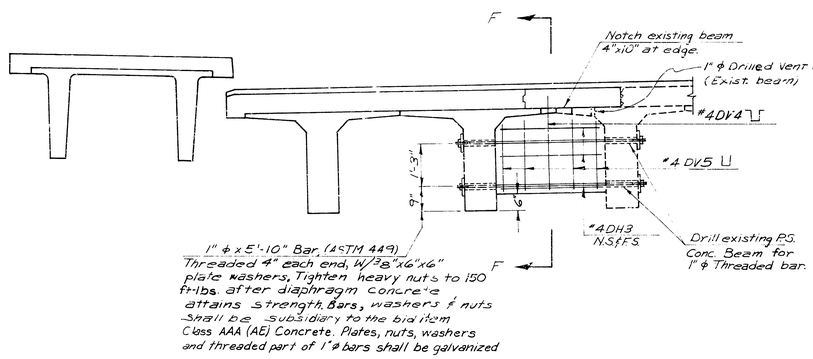
SECTION D-D



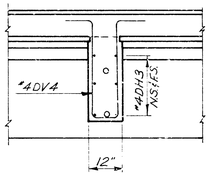
SECTION E-E



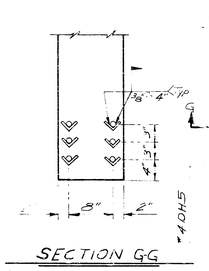
PLAN SECTION AT PIER



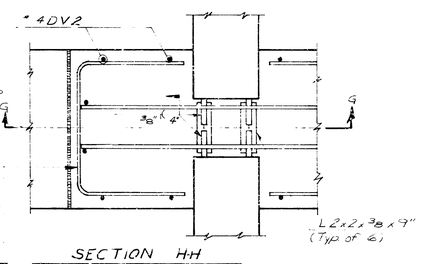
ELEVATION OF MID-SPAN DIAPHPRAM



SECTION F-F



SECTION G-G



SECTION H-H

Note. Angles and welds typical also at sidewalk beams. Rotate angles if necessary. Angles shall be subsidiary to the bid item "Prestressed Concrete Beams"

BEAM ERECTION NOTES:

Beams may be placed on the bridge at any time after the end of the curing period. Beams shall be placed and set as shown, with the tops conforming to the crown of the deck surface. Beams shall be set as indicated on this sheet, with each line of beams carefully aligned across the piers. In case of variation in length, equalize the variation between the two ends of the beam.

Set each beam on a full bed of stiff grout, as noted. To insure proper positioning, set each beam in position, without grout; lift one end at a time just sufficiently to place a grout bed, and set down on the grout.

Beam ends shall have a full bearing on grout, only; they shall not be set on metal bars or rods. Temporary wood or metal wedges may be used to maintain grout thickness and prevent tipping, but if used shall be removed before diaphragm concrete is placed. Temporary short shores under the flanges to the top of the pier may be helpful in maintaining beam position until diaphragm concrete is placed and set up.

See Sheet 3 for Removal of Existing Structure.
See Sheet 8 for Superstructure Layout.

GENERAL NOTES

1. *Specifications:*
Standard Specifications for State Road and Bridge Construction as currently used by the Kansas Dept. of Transportation. (Ed. 1980).

2. *Concrete:*
Concrete for cast-in-place shall be f'c = 3,000 p.s.i. See Sub-Article 703.07 (f)(2) Standard Specifications.
Concrete for Precast shall be f'c = 4,000 p.s.i. Concrete for Prestressed f'c = 5,000 p.s.i. See Article 703.07 (a) Standard Specifications.

3. *Reinforcement:*
Reinforcing bars shall be new billet steel A.S.T.M. Designation A-615 grade 40 without exception. Hoops and spirals may be either plain or deformed bars. See Sub-Section 1601 Standard Specifications.

4. *Precast Piles:*
Precast piles shall conform to the requirements of Article 703.07 (a.)(b.)(c.)(d.) Standard Specifications.

5. *Cast-in-Place Shells:*
Steel shells for Cast-in-Place Concrete Piles shall conform to the requirements of Sub-Section 1606 Standard Specifications.
All piles driven without mandrel shall be of the minimum gages or thicknesses shown above, except fluted pile use No. 9 gage minimum. Piles driven with mandrel shall be of sufficient strength and thickness to withstand driving without injury and to resist harmful distortion and/or buckling due to soil pressure after the mandrel is removed.
Improperly driven, broken or otherwise defective shells shall be removed and replaced or otherwise corrected to the satisfaction of the Engineer, or the driving of an additional pile at no extra cost.
The contractor shall maintain on the job at all times prior to and during the filling of the shells, a light suitable for visual inspection of the pile.

6. *Steel Pile:*
Steel pile shall conform to requirements of Article 1604 (e) Standard Specifications.

7. *Pile Points:*
Pile points shall conform to the dimensions shown and requirements of Sub-Article 1606 (b)(3) Standard Specification. Pile points shall be mill welded to pile.

8. *Welding:*
All field welding shall meet the requirements of Sub-Section 703.06 Standard Specifications.

9. *Paint:*
All paint shall comply with Sub-Section 1806 Standard Specifications, or as specified on the plans.

10. *Test Piles:*
Test Piles shall be driven where called for on the Bridge plans. The test piles located within the limits of the substructure will become a part of the Bridge Pile System.

11. *Splices:*
Splices for Steel Piles and Shell Piling shall be in accordance with details shown on this sheet and shall comply with Sub-Section 703.06 Standard Specifications.
Precast Concrete Pile splices shall comply with Sub-Article 703.07(g)(1) Standard Specifications.
Prestressed Concrete Pile splices shall be made in accordance with the manufacturers recommendations subject to the approval of the Engineer.

12. *Driving Formula:*
Driving Formula shall conform to Sub-Article 703.04 (d.)(3) Standard Specifications.

13. *Mill Test Reports:*
Steel Piles test reports shall comply with Sub-Article 1604 (e.)(3) Standard Specifications.
Steel Shells test reports for cast-in-place piles shall comply with Article 1606 (d.) Standard Specifications.

14. *Measurement and Payment:*
Measurement for all piles shall comply with Sub-Section 703.08 Standard Specifications.
Payment for all piles shall comply with Sub-Section 703.09 Standard Specifications.

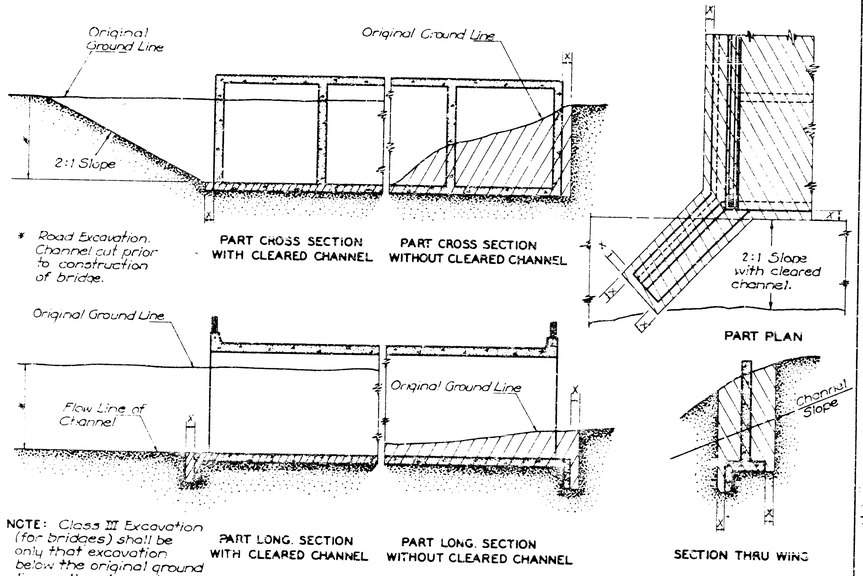
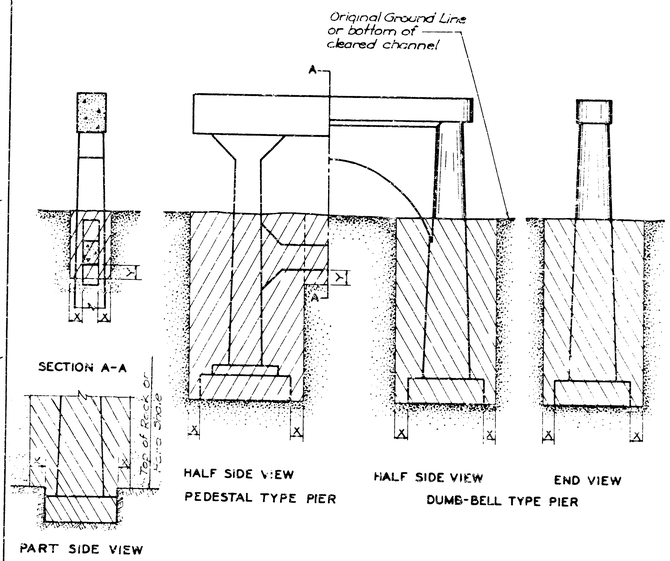
DESIGNED	DETAILED	QUANTITIES	TRACED Koci
DESIGN CK.	DETAIL CK.	QUAN. CK.	TRACE CK.



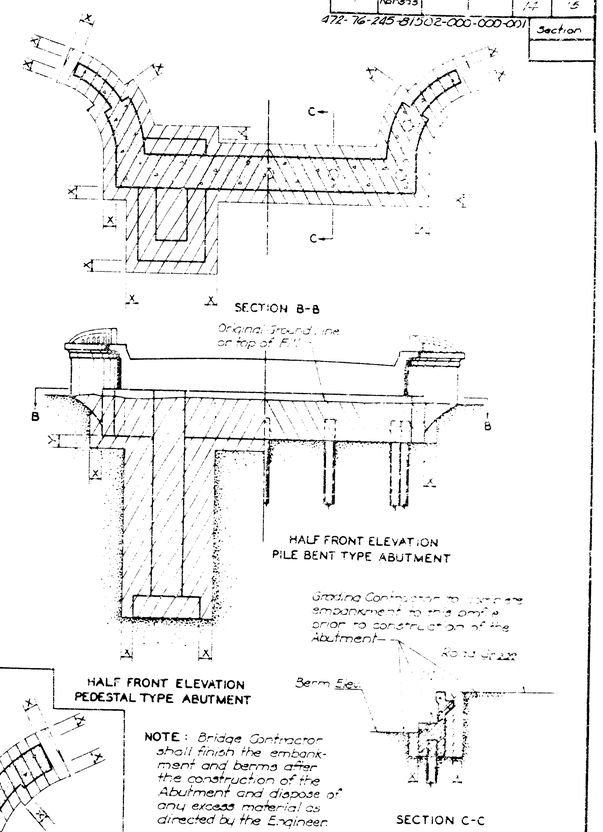
EXCAVATION DETAILS FOR TYPICAL MULTIPLE BOX

Sides of trenches in hard or compacted soil including embankments shall be shored, sheeted, braced or otherwise supported when the trench is more than 5 feet in depth and 8 feet or more in length. In lieu of the shoring, the sides of the trench above the 5 foot level may be sloped to preclude collapse. The slope for average soils shall be 1:1. If the angle of repose of the soil is less, flatter slopes shall be required.



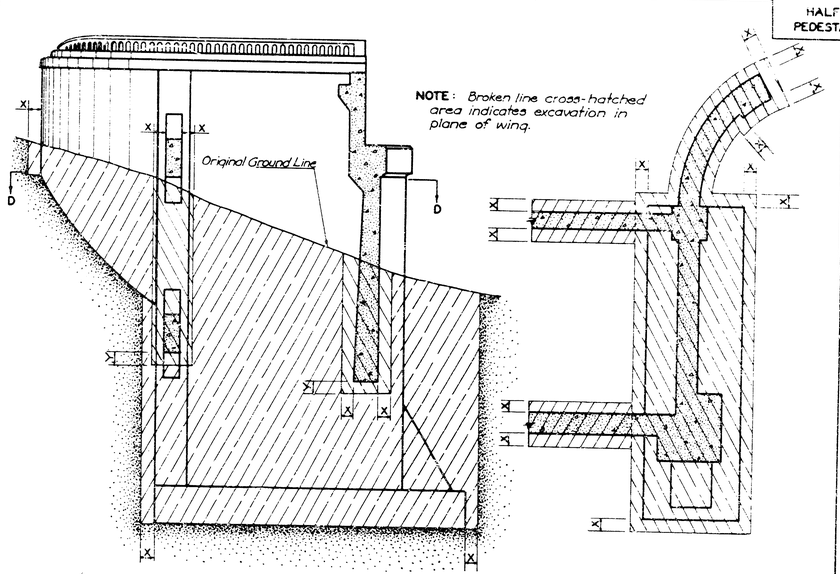
NOTE: When Rock or Hard Shale is encountered all excavation below top of this material shall be to neat lines.

EXCAVATION DETAILS FOR TYPICAL PIERS



NOTE: Bridge Contractor shall finish the embankment and berms after the construction of the Abutment and dispose of any excess material as directed by the Engineer.

EXCAVATION DETAILS FOR TYPICAL ABUTMENTS



EXCAVATION DETAILS FOR TYPICAL U-ABUTMENTS

NOTE: All bridge excavation shall be computed on the basis of the cross-hatched areas and boundary lines indicated on this sheet.
Dimension 'X' shall be 2'-0" unless indicated otherwise on the general plans.
Dimension 'Y' shall be 1'-6" unless indicated otherwise on the general plans.

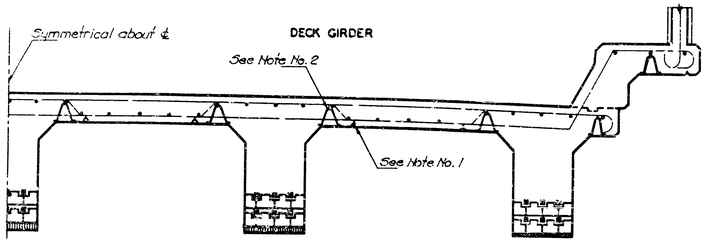
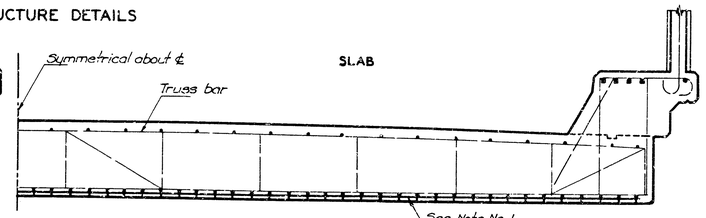
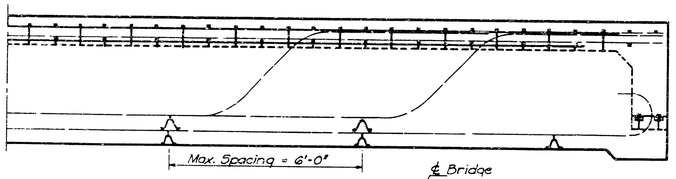
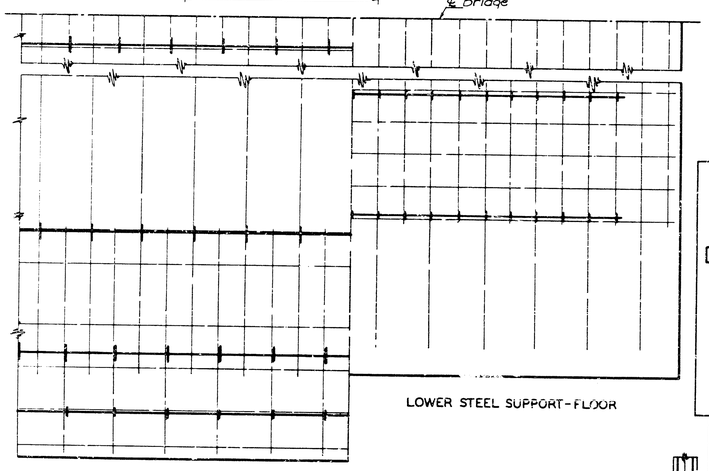
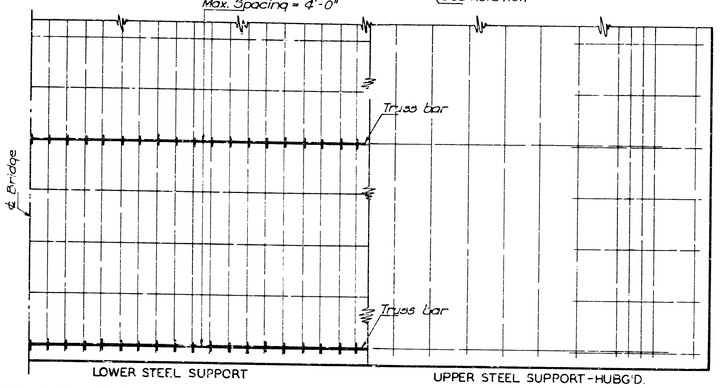
TYPICAL SUPERSTRUCTURE DETAILS

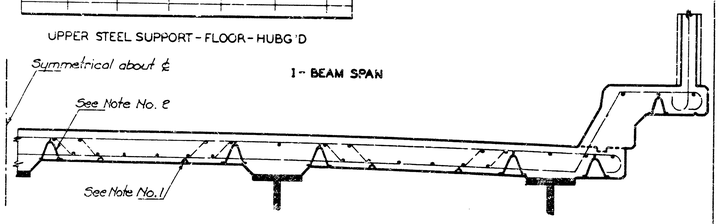


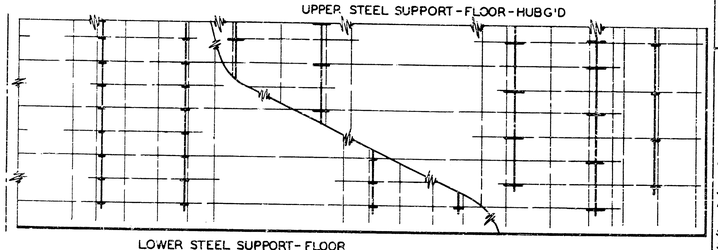




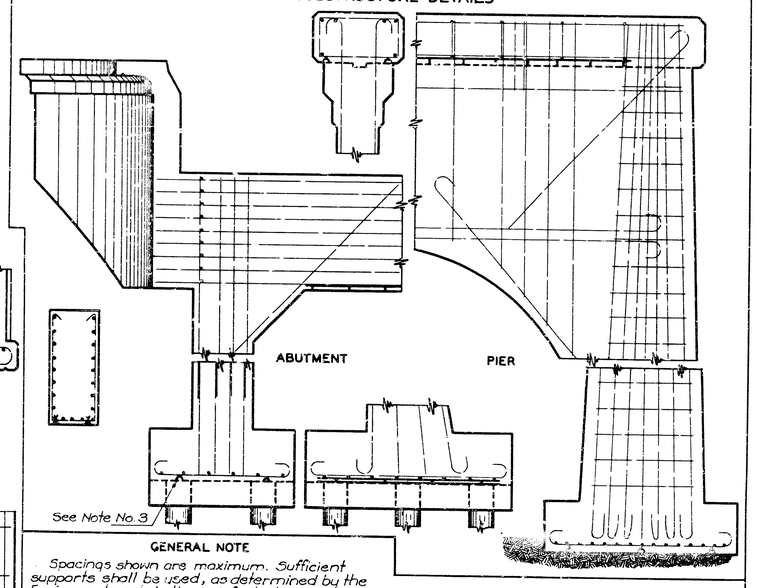








TYPICAL SUBSTRUCTURE DETAILS



GENERAL NOTE

Spacings shown are maximum. Sufficient supports shall be used, as determined by the Engineer, to retain the reinf. steel in position.

Approved designs and arrangements of Supports or Spacers other than as shown on this sheet, may be used with the permission of the Engineer. Component parts of Supports and Spacers shall be securely welded at all contact points. Legs shall be so constructed that only the ends bear upon the forms.

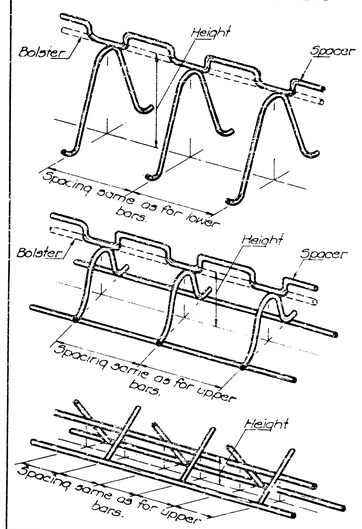
Wire used for Supports and Spacers shall be of sufficient size to insure stability of Reinforcing Steel at the position shown on the Plans, within the limits indicated by Notes 1 & 2. Wire supports shall be supplemented with form ties or other approved devices where necessary.

NOTE 1: The lower side of Reinforcing Steel in these locations shall be not less than one inch (1") from the surface of the concrete.

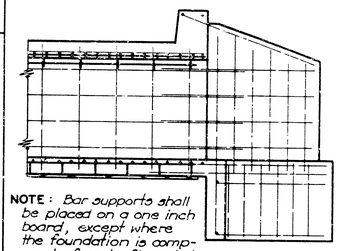
NOTE 2: The upper side of Reinforcing Steel in these locations shall be within the limits shown on the Plans.

NOTE 3: The use of Wire Supports for Reinforcing Steel in these locations is optional. Where they are not used the Steel shall be supported from the forms by means of wire ties or saddles.

BEAM BAR SPACERS & BOLSTERS



TYPICAL CULVERT DETAILS



NOTE: Bar supports shall be placed on a one inch board, except where the foundation is composed of rock, firm shale or a seal course. See Note No. 3.
