DRAINAGE REPORT
COUNTRY CLUB PARK ADDITION
WICHITA, KANSAS
OCTOBER 24, 1988

The proposed two lot plat will be developed for light commercial and office park developments. The development will consist of private streets, parking lots, building complexes, and a lake facility. The lots will drain to the proposed lake by private storm sewers and be discharged by a controlled storm sewer into the Webb Road ditches and continue south. The amount of discharge from the lake will be limited to 32 C.F.S., which is approximately the amount of the undeveloped runoff flow from the site under existing conditions is equivalent to 32 C.F.S.

The proposed lake facility will be capable of retaining the increased amount of developed runoff from the site. Lot 2 will drain across Lot 1 at several locations. A cross lot drainage agreement will be filed for the two lots within the plat.

Final development plans will determine the actual configuration and design of the internal streets, storm sewers, and lake facility.
