

NOTE: The lap shall extend beyond the first transverse wire of each sheet.

The sheets shall be wired securely at the edges and at intervals not to exceed 2'-6" for the full width of the sheet. Approx. weight of wire mesh = 44 lbs. per 100 sq. ft.

Other methods for fastening the sheets of wire mesh at the laps may be used with the approval of the Engineer.

* See special provisions for type of longitudinal joint for each project.

NOTE: A lineal polyethylene or polyolefin (semi-rigid) 3" (nominal), 20 mil. (.020"), strip shall be inserted vertically into the fresh concrete pavement by approved methods.

NOTE: Longitudinal joint formed by sawing 2 1/2" deep and 1/4" wide and filled as specified in special provisions.

There may be a tolerance of 10 feet in setting the basket at the end of the pour; that is, the contraction joint may be not less than 20'-0" or more than 40'-0" at the end of the pour. See Std. No. 720.1 & 735.1 for Contraction Joint Details.

EXPANSION JOINT DETAIL (Except for load transfer devices)

NOTE: Pressure Relief Joints (without load transfer devices) shall be placed at the ends of the pavement slab where the new pavement abuts the ends of bridges or other rigid structures. For details of Pressure Relief Joint at bridge ends, see Std. No. 718A, 718B or 719.

Unless otherwise noted, load transfer devices as shown in detail on other standard sheets in the plans, shall be used at all expansion & contraction joints.
